

# Design Evaluation: Heuristics

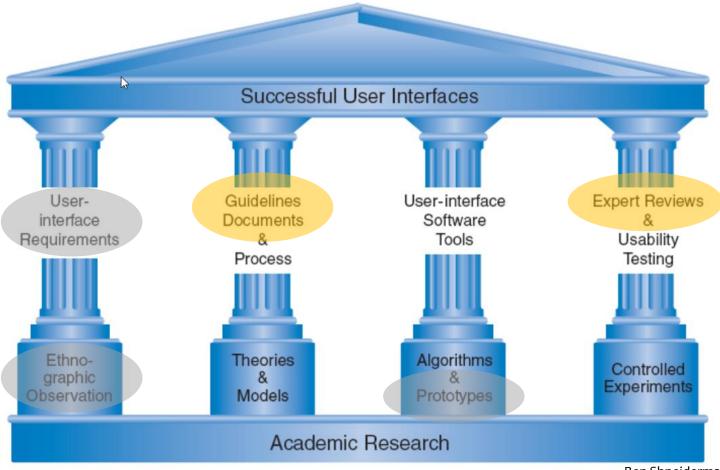

**Human Computer Interaction** 

Fulvio Corno, Luigi De Russis Academic Year 2019/2020

# The Four Pillars of Design

Ben Shneiderman & Catherine Plaisant, Designing the User Interface: Strategies for Effective Human-Computer Interaction

#### Goals

Generating design Evaluating generated solutions designs Guidelines Expert reviews and heuristics **Principles** Usability testing Theories Controlled experiments

# Evaluation

Testing the usability, functionality and acceptability of an interactive system

#### Goal

- Evaluation: «Evaluation tests the usability, functionality and acceptability of an interactive system»
  - According to the design stage (sketch, prototype, final)
  - According to the initial goals
  - Alongside the different usability dimensions
  - Using a range of different techniques
- Identify and correct usability issues as soon as possible

#### **Evaluation approaches**

- Evaluation may take place:
  - In the laboratory
  - In the field
- Involving users (Empirical Evaluation):
  - Experimental methods
  - Observational methods
  - Query methods
  - Formal or semi-formal or informal

- Based on expert evaluation:
  - Analytic methods
  - Review methods
  - Model-based methods
  - Heuristics
- Automated evaluation:
  - Simulation and software measures
  - Formal evaluation with models and formulas
  - Especially for low-level issues

# Cognitive walkthrough

A simple technique to analyze all individual step in an interaction path

# **Cognitive Walkthrough**

- Step-by-step revision of a sequence of actions (interaction steps) to perform a given task
- Evaluators examine each step, looking for possible problems
- Particularly suited for systems designed for learning-by-exploration

# Walkthrough organization

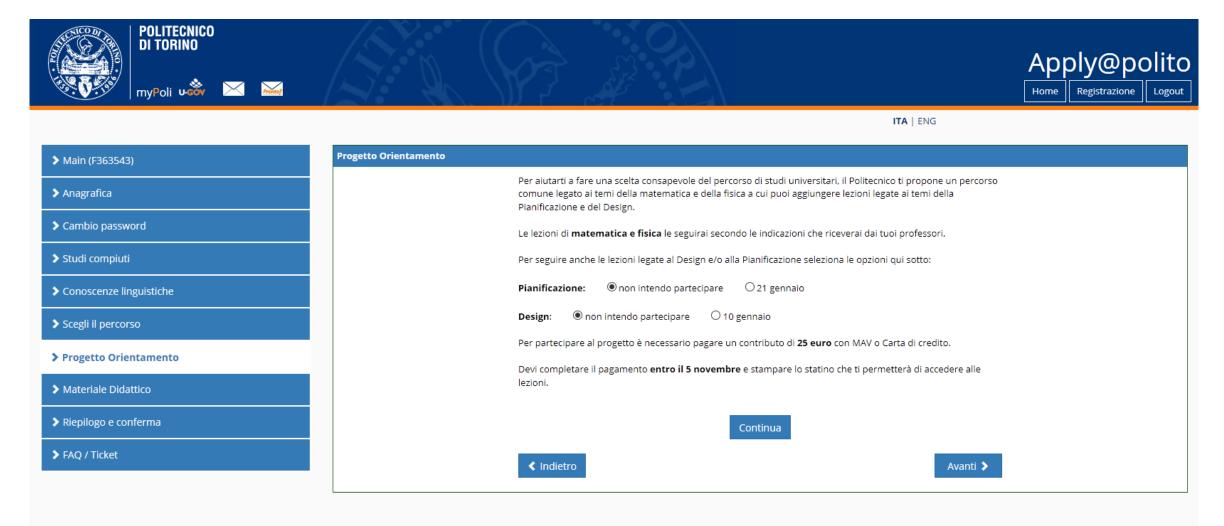

#### Walkthrough specification

- A specification or prototype of the system
- A description of the task the user is to perform on the system
- A complete, written list of the actions needed to complete the task
- An indication of who the users are (experience, knowledge)

#### For each step, you must check

- Is the effect of the action the same as the user's goal at that point?
- Will users see that the action is available?
- Once users have found the correct action, will they know it is the one they need?
- After the action is taken, will users understand the feedback they get?

#### **Example**

© Politecnico di Torino Corso Duca degli Abruzzi, 24 - 10129 Torino, ITALY

# **Heuristic Evaluation**

Experts check potential issues on your design, by referring to a set of heuristic criteria

# When is Design Critique useful?

- Before user testing
  - To save effort
  - Solving easy-to-solve problems
  - Leaving user testing for bigger issues
- Before redesigning
  - Identify the good parts (to be kept) and the bad ones (to be redesigned)
- To generate evidence for problems that are known (or suspected)
  - From 'murmurs' or 'impressions' to hard evidence
- Before release
  - Smoothing and polishing

#### **Heuristic Evaluation**

- A method developed by Jacob Nielsen (1994)
  - Structured design critique
  - Using a set of simple and general heuristics
  - Executed by a small group of experts (3-5)
  - Suitable for any stage of the design (sketches, UI, ...)
  - Goal: find usability problems in a design
- Also popularized as "Discount Usability"

#### **Basic idea**

- Define a set of heuristics (or principles)
- Give those heuristics to a group of experts
  - Each expert will use heuristics to look for problems in the design
- Experts work independently
  - Each expert will find different problems
- At the end, experts communicate and share their findings
  - Findings are analyzed, aggregated, ranked
- The discovered violations of the heuristics are used to fix problems or to re-design

https://www.nngroup.com/articles/how-to-conduct-a-heuristic-evaluation/

#### **Heuristics**

- Nielsen proposed 10 heuristic rules
  - Good at finding most design problems
  - Inspired and connected to the Design Principles (→Guidelines)
- In a specific context, application domain, or for specific design goals ...
  - ... new heuristics can be defined
  - ... some heuristic can be ignored

#### Phases of Heuristic Evaluation

- Pre-evaluation training
  - Give evaluator information about the domain and the scenario to be evaluated
- Evaluation
  - Individual
- Severity Rating
  - First, individually
  - Then, aggregate and find consensus
- Debriefing
  - Review with the design team

# **Evaluation (I)**

- Define a set of tasks, that the evaluators should analyze
- For each task, the evaluator should step through the design several times, and inspect the UI elements
  - On the real design, or on a preliminary prototype
- At each step, check the design according to each of the heuristics
  - o 1st step, get a general feeling for the interaction flow and general scope
  - 2<sup>nd</sup> step (and following), focus on specific UI elements, knowing where they fit in the general picture
- Heuristics are used as a "reminder" of things to look for
  - Other types of problems can also be reported

# **Evaluation (II)**

- Comments from each evaluator should be recorded or written
  - There may be an observer, taking notes
  - The observer my provide clarifications, especially it the evaluator is not a domain expert
- Session duration is normally 1h 2h
- Each evaluator should provide a list of usability problems
  - Which heuristic (or other usability rule) has been violated, and why
    - Not a subjective comment, but a reference to a known principle
  - Each problem reported separately, in detail

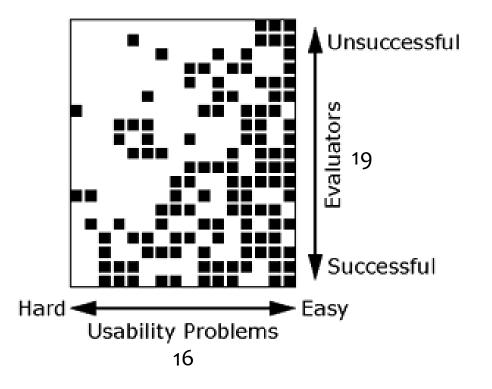

# **Evaluation (III)**

- Where problems may be found
  - A single location in the UI
  - Two or more locations that need to be compared
  - Problem with the overall UI structure
  - Something is missing
    - May be due to prototype approximation
    - May still be unimplemented

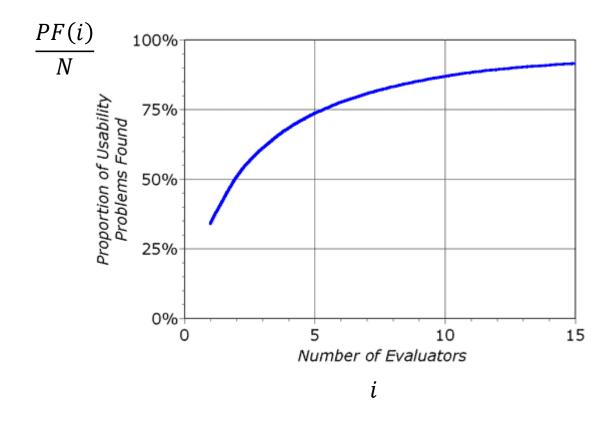

#### Multiple evaluators

- No evaluator finds all problems
  - $\circ$  Even the best one finds only ~1/3
- Different evaluators find different problems
  - Substantial amount of nonoverlap
- Some evaluators find more problems than others

#### How many evaluators?

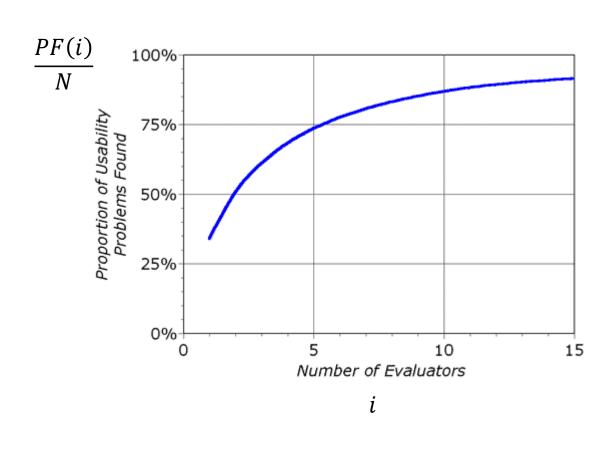

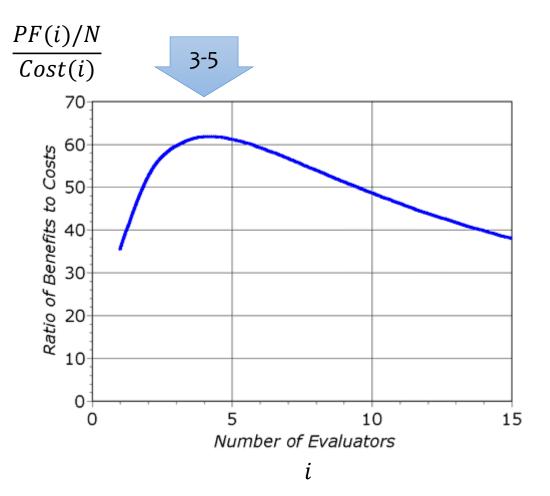

• 
$$PF(i) = N(1 - (1 - l)^i)$$

- PF(i): problems found
- *i*: number of *independent* evaluators
- N: number of existing (but unknown) usability problems
- l: ratio of usability problems found
  by a single evaluator

#### How many evaluators?

 $Cost(i) = Fixed + Fee \times i$ 

#### **Severity Rating**

- We need to allocate the most resources to fix the most serious problems
- We need to understand if additional usability efforts are required
- Severity is a combination of:
  - Frequency with which the problem occurs: common or rare?
  - o **Impact** of the problem if it occurs: easy to overcome or difficult?
  - O Persistence: is it one-time or will it occur many times to users?
- Define a combined severity rating
  - Individually, for each evaluator

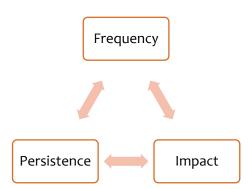

https://www.nngroup.com/articles/how-to-rate-the-severity-of-usability-problems/

# **Severity Ratings scale**

0	No problem	I don't agree that this is a usability problem at all
1	Cosmetic problem only	need not be fixed unless extra time is available on project
2	Minor usability problem	fixing this should be given low priority
3	<b>Major</b> usability problem	important to fix, so should be given high priority
4	Usability <b>catastrophe</b>	imperative to fix this before product can be released

#### **Combined severity ratings**

- Severity ratings from one evaluator have been found unreliable, they should not be used
- After all evaluators completed their rankings
  - Either let them discuss, and agree on a consensus ranking
  - Or just compute the average of the 3-5 ratings

# Debriefing

- Meeting of all evaluators, with observers, and members of the development team
- Line-by-line analysis of the problems identified
  - O Discussion: how can we fix it?
  - O Discussion: how much will it cost to fix it?
- Can also be used to brainstorm general design ideas

# **Heuristic Evaluation vs User Testing**

#### **Heuristic Evaluation**

- Faster (1-2h per evaluator)
- Results are pre-interpreted (thanks to the evaluators)
- Could generate false positives
- Might miss some problems

#### **User Testing**

- Need to develop sw, and prepare the set-up
- More accurate (by definition!)
  - Actual users and tasks

# **Heuristic Evaluation vs User Testing**

#### **Heuristic Evaluation**

- Faster (1-2h per evaluator)
- Results are pre-interpreted (thanks to the evaluators)
- Could generate falcons
- Might mi s som

#### **User Testing**

- Need to develop sw, and prepare the set-up
- More accurate (by definition!)
  - Actual users and tasks
- Alternate the methods!
  - Find different problems
  - Don't waste participants

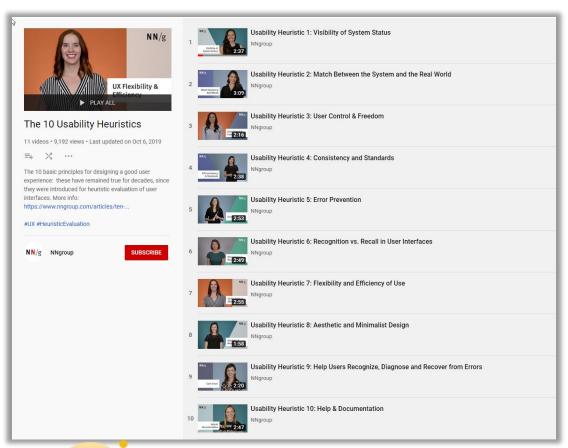

https://www.nngroup.com/articles/usability-problems-found-by-heuristic-evaluation/

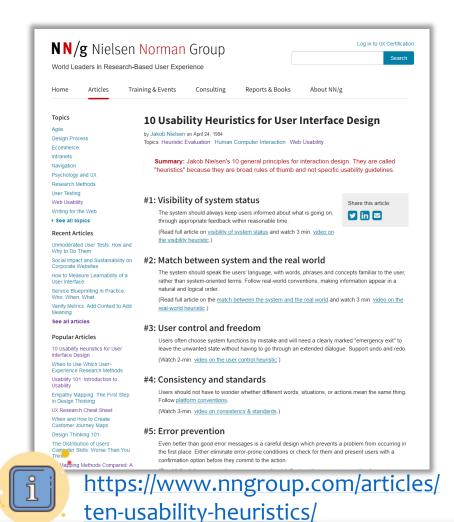

# Nielsen's Usability Heuristics

10 Usability Principles to be used in Heuristic Evaluation

#### 10 Nielsen's Usability Heuristics

# 10 Nielsen's Usability Heuristics

- #1: Visibility of system status
- #2: Match between system and the real world
- #3: User control and freedom
- #4: Consistency and standards
- #5: Error prevention

- #6: Recognition rather than recall
- #7: Flexibility and efficiency of use
- #8: Aesthetic and minimalist design
- #9: Help users recognize, diagnose, and recover from errors
- #10: Help and documentation

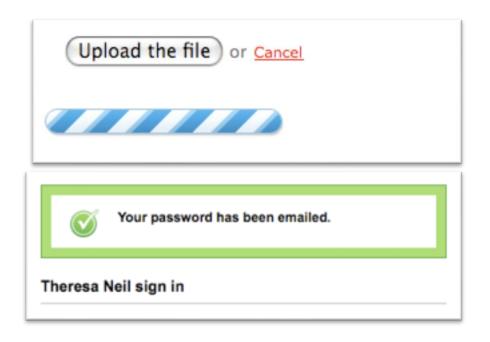

#### #1: Visibility of system status

 The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.

#### #1: Visibility of system status

 The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.

#### Which feedback?

- Time
  - Execution time for tasks
- Space
  - E.g., occupation of cloud storage
- Change
  - Ensure that the user is aware of changes that he requested (e.g., save, delete, send, ...)

- Action
  - What is happening (running, stopped, ...), in a redundant way
- Next steps
  - What will happen because of your action, and your possible next actions at this point
- Completion
  - Clarify when a task has been finalized

# Rule of thumb (time)

- If the execution time is...
- ... Less than 1 second ⇒ just show the outcome of the action
- ... Around 1-2 seconds ⇒ show feedback that the action is underway
- ... More 2-3 seconds ⇒ show progress (percentage, estimated time, ...)

#### #2: Match between system and the real world

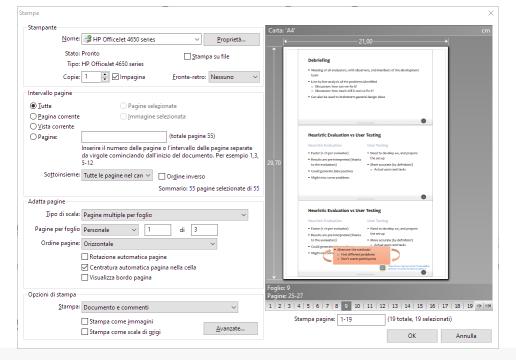

- The system should speak the users' language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow realworld conventions, making information appear in a natural and logical order.
- Use familiar metaphors and language

#### #2: Match between system and the real world

The system should speak the users' language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow realworld conventions, making information appear in a natural and logical order.

#### **Exploit Familiarity**

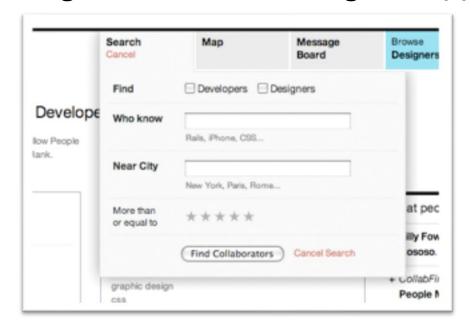

- Familiar Metaphors
  - Files, paper, folders, highlighters, ...
- Familiar Language
  - Avoid jargon, acronyms, etc that could be unknown to your users
- Familiar Categories
- Familiar Choices
  - E.g., explain the meaning of the error message (what happened, what are the consequences, what are the available options) in a simple way

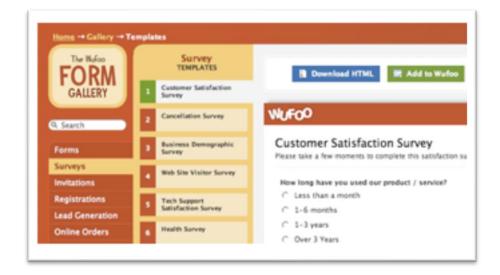

#### #3: User control and freedom

 Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.

#### **#3:** User control and freedom

 Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.

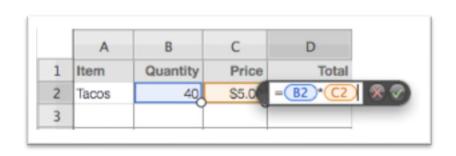

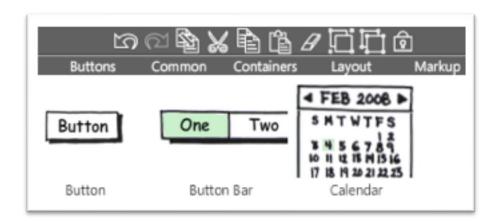

- Always provide a "back" (or equivalent) button
- Allow users to "explore" different alternative paths
  - o Except for one-shot wizard-like paths, aimed at novices or first-time users

#### **#3:** User control and freedom

 Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.

#### #4: Consistency and standards

 Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.

#### **#4:** Consistency and standards

 Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.

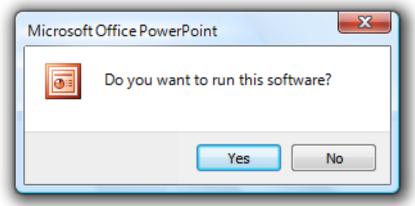

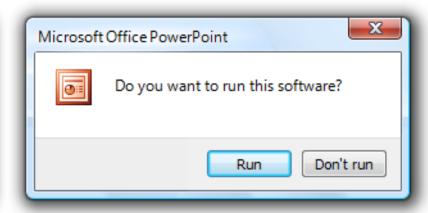

- Consistent layout for dialogs and forms
  - E.g., position of the navigation elements
  - E.g., position of the confirmation buttons
- Consistent meaning for Ok/Cancel, Yes/No choices
  - E.g., avoid: "Do you want to interrupt task?"
  - Still better, label buttons with the actual effect "Insert", "Interrupt", ...
- Categories, lists of names, geographical regions, etc, should be taken from "standard" vocabularies

#### Examples

Bad Acceptable Better

#### **#5: Error prevention**

Even better than good error messages is a careful design which prevents a problem from occurring in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

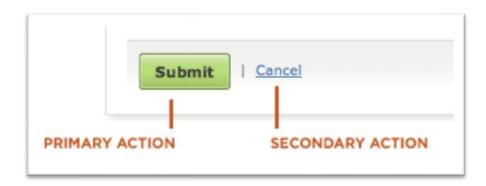

- Preventing data loss
- Prevent clutter
- Prevent confusing flow
- Prevent bad input
- Prevent unnecessary constraints (e.g., provide defaults for missing data)

#### **#5: Error prevention**

Even better than good error messages is a careful design which prevents a problem from occurring in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

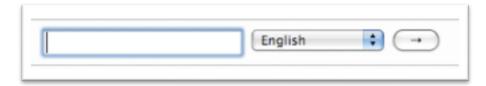

#### **#5: Error prevention**

Even better than good error messages is a careful design which prevents a problem from occurring in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

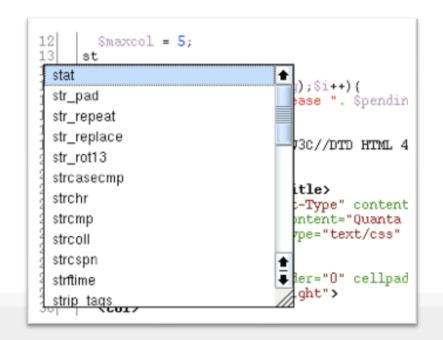

## #6: Recognition rather than recall

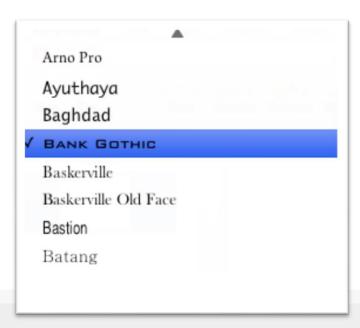

• Minimize the user's memory load by making objects, actions, and options visible. The user should not have to remember information from one part of the dialogue to another. Instructions for use of the system should be visible or easily retrievable whenever appropriate.

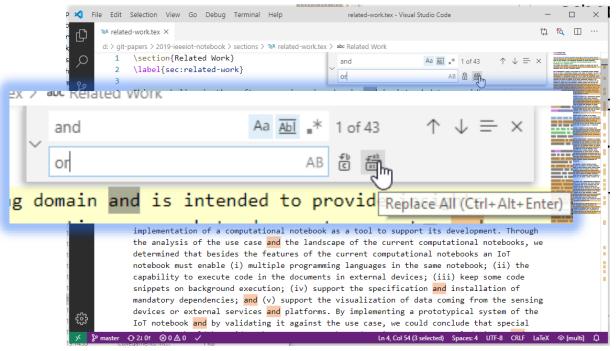

#### #6: Recognition rather than recall

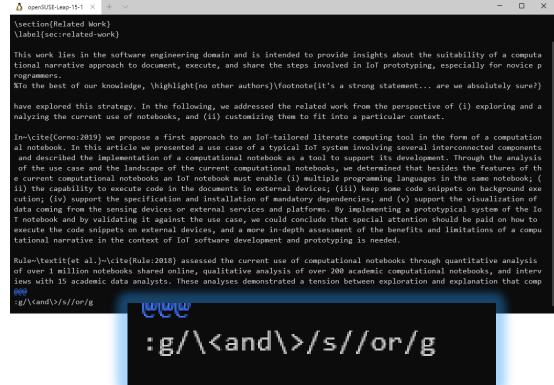

• Minimize the user's memory load by making objects, actions, and options visible. The user should not have to remember information from one part of the dialogue to another. Instructions for use of the system should be visible or easily retrievable whenever appropriate.

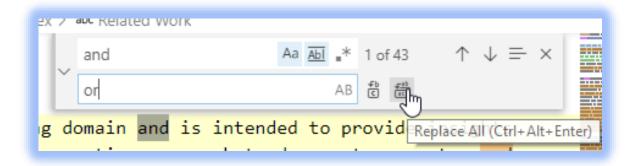

#### **Example**

- Avoid codes (use explicit names)
  - o E.g., L, VL, EL, EA, ...???
- Avoid extra hurdles
  - o E.g., asking for unnecessary (or premature) information
- Provide previews
  - Code completion
  - o Page preview
  - Order summary
  - Itinerary
  - O ...

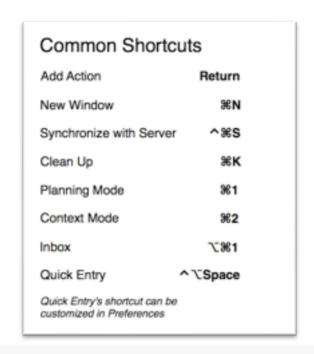

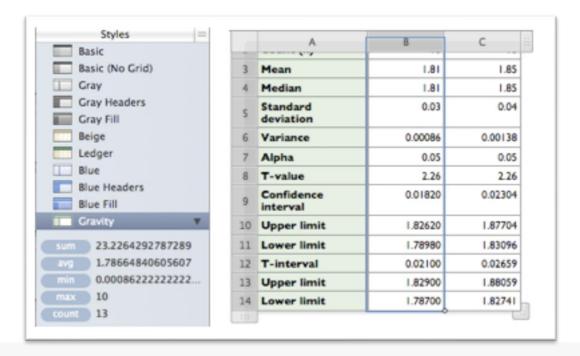

#### **#7: Flexibility and efficiency of use**

 Accelerators — unseen by the novice user — may often speed up the interaction for the expert user such that the system can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

#### **#7: Flexibility and efficiency of use**

 Accelerators — unseen by the novice user — may often speed up the interaction for the expert user such that the system can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

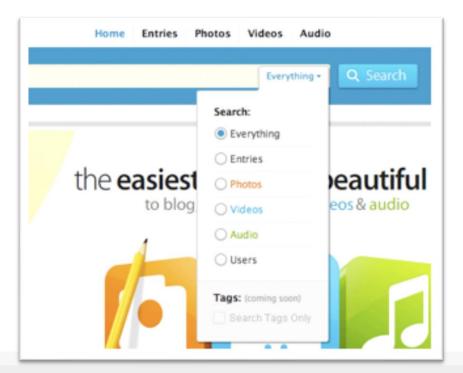

- Flexibility = Default + Options
  - E.g., present some popular choices, but let the user enter a custom one (train ticket machines)
- Exploit background information for providing more information
  - o E.g., weather forecasts in a calendar interface
- Proactivity
  - o E.g., "mark as spam" proposed to "unsubscribe", too
- Recommendations
- Provide relevant information, only

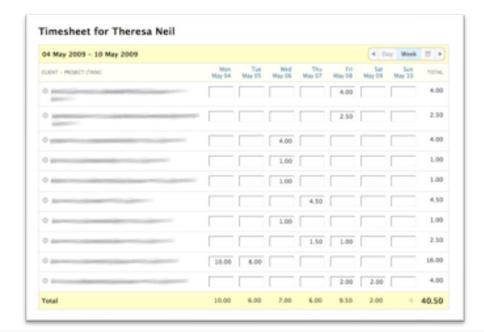

#### #8: Aesthetic and minimalist design

Dialogues should not contain information which is irrelevant or rarely needed.
 Every extra unit of information in a dialogue competes with the relevant units of information and diminishes their relative visibility.

#### #8: Aesthetic and minimalist design

Dialogues should not contain information which is irrelevant or rarely needed.
 Every extra unit of information in a dialogue competes with the relevant units of information and diminishes their relative visibility.

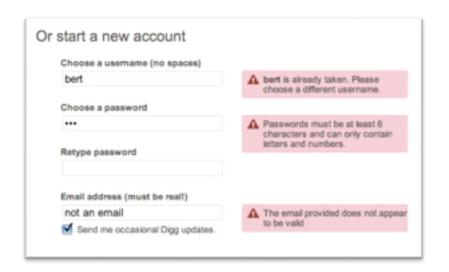

- Key information must be "above the fold"
  - Especially on low-resolution devices
- Keep high signal-to-noise ratio
  - o Colors, fonts, backgrounds, animations, ...
  - o Borders, dividers, ...
- Minimalistic login experience
- Accept redundant ways of entering information
- Prune features that are outside the "core" functionality

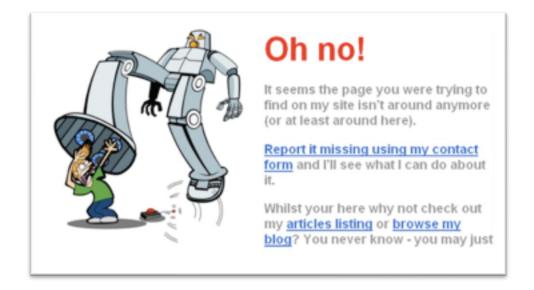

# #9: Help users recognize, diagnose, and recover from errors

 Error messages should be expressed in plain language (no codes), precisely indicate the problem, and constructively suggest a solution.

# #9: Help users recognize, diagnose, and recover from errors

 Error messages should be expressed in plain language (no codes), precisely indicate the problem, and constructively suggest a solution.

- Make errors easy to identify
  - o Colors, fonts, ...
- Make problem clear
  - o Problem cause
  - Problem location
- Provide a solution
  - Give a suggestion
  - Show a path forward
  - Propose an anternative

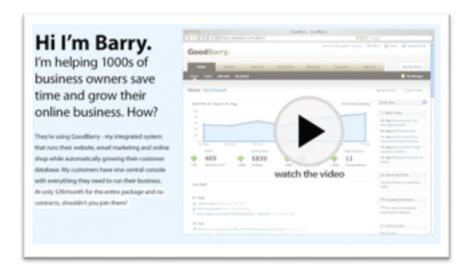

#### #10: Help and documentation

Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

#### #10: Help and documentation

Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

#### #10: Help and documentation

Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

- Provide examples
  - In documentation
  - In complex choices
- Help the user understanding the error gravity
  - E.g., printing outside margins
- Provide 'tips' for showing new actions or steps
- Use pop-overs to point to changes in UI (or for first usage)
- Avoid too-opaque "terms and conditions" (summarize, if possible)
