

Java collections framework

Commonly reusable collection data structures

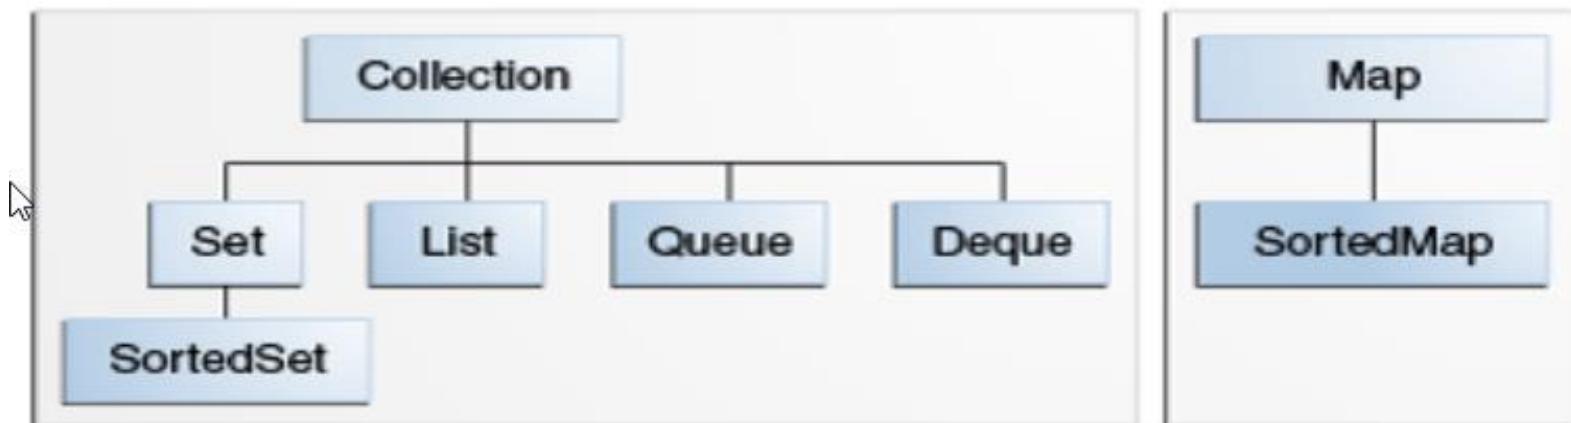

Java Collections Framework (JCF)

- ▶ **Collection**
 - ▶ an object that represents a group of objects
- ▶ **Collection Framework**
 - ▶ A unified *architecture* for representing and manipulating collections
 - ▶ Such collections are manipulated independent of the details of their representation

Infrastructure

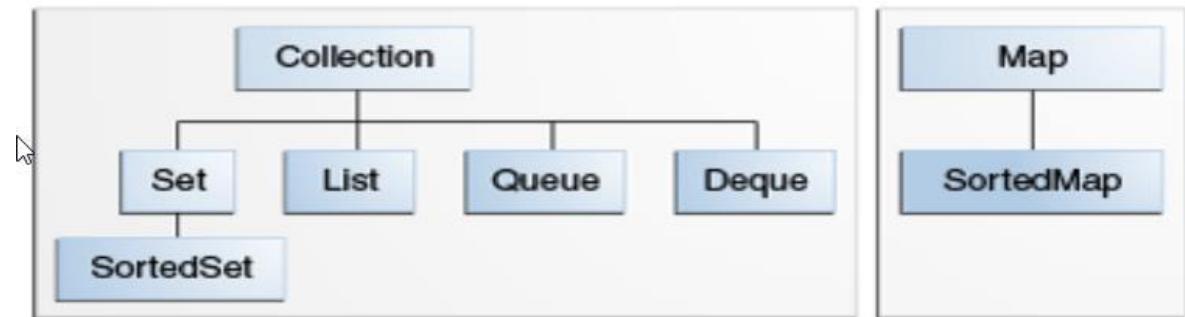

- ▶ These interfaces form the basis of the framework
 - ▶ Some types of collections **allow duplicate** elements, others do not
 - ▶ Some types of collections are **ordered**, others are **unordered**
- ▶ The Java platform doesn't provide any direct implementations of the Collection interface, but provides implementations of more specific sub-interfaces, such as Set and List and Maps

<https://docs.oracle.com/javase/tutorial/collections/interfaces/index.html>

Collection interface

- ▶ A **Collection** represents a group of objects known as its *elements*
- ▶ The Collection interface is the **least common denominator** that all collections implement.
- ▶ It is Used
 - ▶ to pass collections around
 - ▶ to manipulate them when maximum generality is desire
- ▶ **Collection** extends **Iterable**

A note on iterators

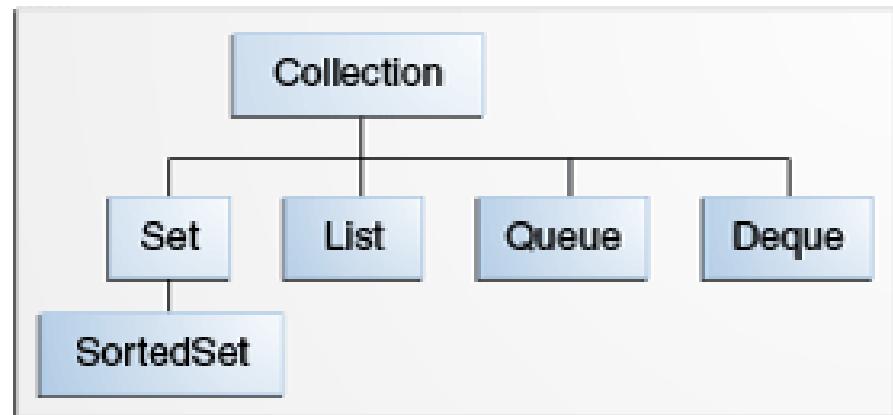

- ▶ An **Iterator** is an object that enables you to traverse through a collection (and to remove elements from the collection selectively)
- ▶ You get an Iterator for a collection by calling its iterator() method.
- ▶ Several languages supports “iterators”. E.g., C++, PHP, Python, Ruby, Go...

```
public interface Iterator<E> {  
    boolean hasNext();  
    E next();  
    void remove(); //optional  
}
```

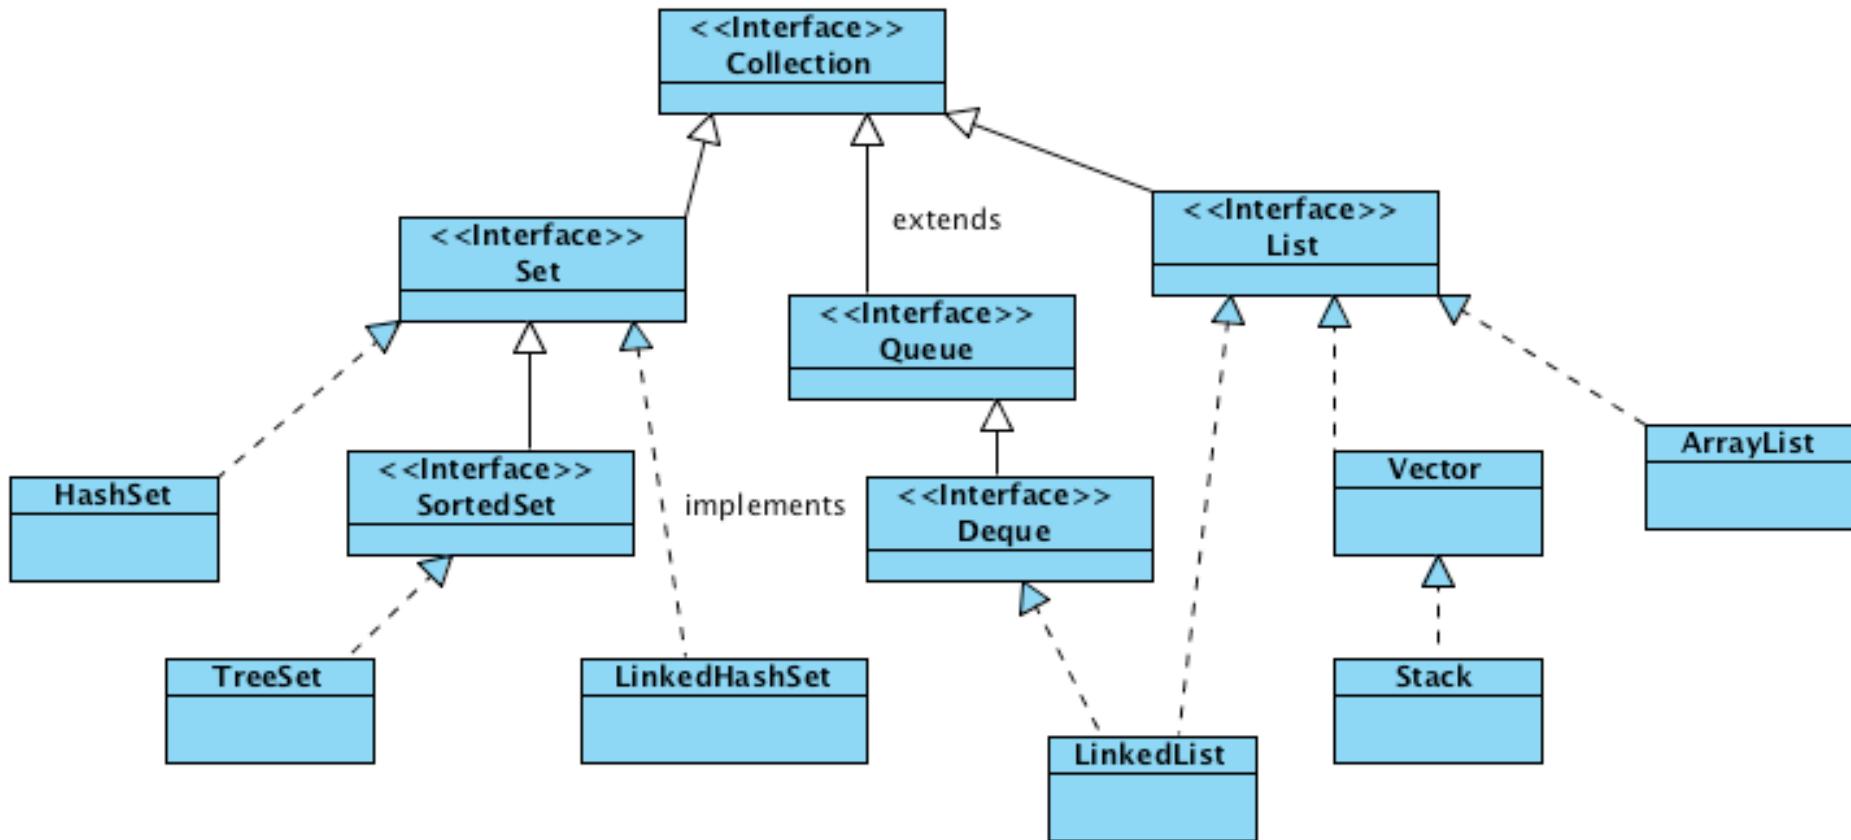

Main Interfaces

- ▶ **List**
 - ▶ A more flexible version of an array
- ▶ **Queue & Priority Queue**
 - ▶ The order of arrival does matter, or the urgency
- ▶ **Deque**
 - ▶ Double-ended Queue (bi-directional)
- ▶ **Set**
 - ▶ No order, no duplicate elements

Collection Family Tree

Collection interface

```
public interface Collection<E> extends Iterable<E> {  
    int size();  
    boolean isEmpty();  
    boolean contains(Object element);  
    boolean add(E element); //optional  
    boolean remove(Object element); //optional  
    Iterator<E> iterator();  
  
    boolean containsAll(Collection<?> c);  
    boolean addAll(Collection<? extends E> c); //optional  
    boolean removeAll(Collection<?> c); //optional  
    boolean retainAll(Collection<?> c); //optional  
    void clear(); //optional  
  
    Object[] toArray();  
    <T>T[] toArray(T[] a);  
}
```

Collection interface

Basic Operations

```
public interface Collection<E> extends Iterable<E> {  
    int size();  
    boolean isEmpty();  
    boolean contains(Object element);  
    boolean add(E element);                                //optional  
    boolean remove(Object element);                      //optional  
    Iterator<E> iterator();  
  
    boolean containsAll(Collection<?> c);  
    boolean addAll(Collection<? extends E> c); //optional  
    boolean removeAll(Collection<?> c);          //optional  
    boolean retainAll(Collection<?> c);           //optional  
    void clear();                                     //optional  
  
    Object[] toArray();  
    <T>T[] toArray(T[] a);  
}
```

generics

Collection interface

```
public interface Collection<E> extends Iterable<E> {  
    int size();  
    boolean isEmpty();  
    boolean contains(Object element);  
    boolean add(E element);  
    boolean remove(Object element);  
  
    Bulk Operations  
    boolean containsAll(Collection<?> c);  
    boolean addAll(Collection<? extends E> c); //optional  
    boolean removeAll(Collection<?> c); //optional  
    boolean retainAll(Collection<?> c); //optional  
    void clear();  
  
    Object[] toArray();  
    <T>T[] toArray(T[] a);  
}
```

A callout bubble points to the `<? extends E>` parameter in the `addAll` method. It contains the text "wildcard" followed by two annotations: "`<?`" is optional and "`extends E`" is optional.

A callout bubble points to the `<T>T[]` parameter in the `toArray` method. It contains the text "either extends or implements".

Collection interface

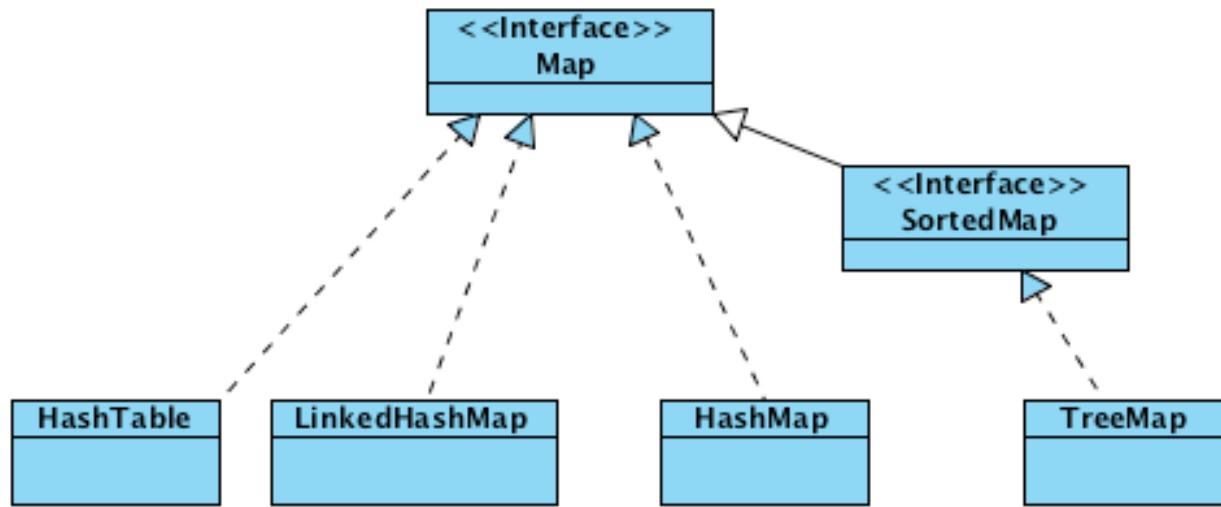

```
public interface Collection<E> extends Iterable<E> {  
    int size();  
    boolean isEmpty();  
    boolean contains(Object element);  
    boolean add(E element); //optional  
    boolean remove(Object element); //optional  
    Iterator<E> iterator();  
  
    boolean containsAll(Collection<?> c);  
    boolean addAll(Collection<? extends E> c); //optional  
    boolean removeAll(Collection<?> c); //optional  
    boolean retainAll(Collection<?> c); //optional  
    //optional  
  
    Object[] toArray();  
    <T>T[] toArray(T[] a);  
}
```

Array Operations

Map interface

- ▶ A **Map** is an object that maps keys to values
- ▶ A map cannot contain duplicate keys: each key can map to at most one value
- ▶ **Map** does not extend **Iterable**, but it is possible to get an iterator through **entrySet()**
- ▶ **Notez bien:** Maps do not extend from **java.util.Collection**, but they're still considered to be part of the “collections framework”

Map Family Tree

Map interface

Basic Operations

```
public interface Map<K, V> {  
    V put(K key, V value);  
    V get(Object key);  
    V remove(Object key);  
    boolean containsKey(Object key);  
    boolean containsValue(Object value);  
    int size();  
    boolean isEmpty();  
  
    void putAll(Map<? extends K, ? extends V> m);  
    void clear();  
}
```

[...]

Map interface

```
public interface Map<K, V> {  
    V put(K key, V value);  
    V get(Object key);  
    V remove(Object key);  
    boolean containsKey(Object key);  
    boolean containsValue(Object value);  
    int size();
```

Bulk Operations

```
void putAll(Map<? extends K, ? extends V> m);  
void clear();
```

[...]

Map interface

[...]

```
public Set<K> keySet();  
public Collection<V> values();  
Interface for entrySet elements entrySet();
```

```
public interface Entry {  
    K getKey();  
    V getValue();  
    V setValue(V value);  
}  
}
```

Map interface

Collection Views

```
public Set<K> keySet();  
public Collection<V> values();  
public Set<Map.Entry<K,V>> entrySet();
```

```
public interface Entry {  
    K getKey();  
    V getValue();  
    V setValue(V v);  
}
```

```
}
```

```
for (Map.Entry<Foo,Bar> e : map.entrySet())  
{  
    Foo key = e.getKey();  
    Bar value = e.getValue();  
}
```

Implementations

Interfaces	Hash table Implementations	Resizable array Implementations	Tree Implementations	Linked list Implementations	Hash table + Linked list Implementations
Set	HashSet		TreeSet		LinkedHashSet
List		ArrayList		LinkedList	
Queue					
Deque		ArrayDeque		LinkedList	
Map	HashMap		TreeMap		LinkedHashMap
